

Why Choose an Associated Skin Care Professionals Practitioner?

Your skin care treatments should be provided by a properly trained professional. Don't hesitate to ask your skin care therapist about her background, training, and experience—especially as it relates to the treatment you are considering. As a member of ASCP, your skin care professional's state licensing credentials and/or core training have been validated. ASCP member materials emphasize that each client's skin is as unique as the individual beneath it, and that skin type can

change depending on lifestyle, medications, allergies, or diet. ASCP members agree to follow a code of ethics, which ensures that you're treated responsibly and with the utmost respect. ASCP also provides comprehensive resources that allow members to keep up with the ever-changing trends and treatments the way only a true professional can, making certain you'll receive the most up-to-date skin care therapies available. (You can find an ASCP professional in your area at www.ascpskinicare.com or by calling 800-789-0411.)

Chemical Peels

you're taking acne medication, Retin-A or Accutane, talk to your esthetician about stopping the medication before and during treatment to avoid complications.

How Should I Prepare for Treatment?

Check with your esthetician and/or doctor about stopping any of your current medications that might interfere with the treatment. Your skin care professional can review any other contraindications with you prior to your treatment to determine if a chemical peel is right for you.

What is a Chemical Peel?

Chemical peels are used to remove the outermost layer of the skin and reveal the fresh, less-wrinkled layer below. In these procedures, a chemical formula is placed on the skin, which then peels off, eliminating dead cells and leaving the skin with clarity, luminosity, and showing an improvement in fine lines.

Who Can Benefit from Chemical Peels?

Chemical peels are used for age management and effectively improve the feel and appearance of the skin by reducing fine lines and wrinkles caused by sun exposure, aging, and genetics. They can also treat age spots, freckles, and other superficial hyperpigmentation. Most skin colors and types can benefit from chemical peels, though it is best to check with your esthetician about which peel might be right for you. If

What Can I Expect During a Chemical Peel?

The skin is cleansed thoroughly with an oil-reducing solution, and protective materials are placed on the eyes and hair. One or more chemical mixtures, such as glycolic acid, trichloroacetic acid, salicylic acid, lactic acid, or barbotic acid (phenol), are dabbed onto the areas of the skin to be treated. The chemicals then react with the skin to produce a "controlled wound," allowing fresh skin to regenerate and emerge. A warming or stinging sensation may occur during the treatment, and may last about five to ten minutes. After most chemical peels, the skin will look as though it has been sunburned. Then it will begin to peel and may look scaly. This is a normal reaction to the peel and is the process of the skin rejuvenating itself. This process takes about three to seven days.

Your esthetician may recommend a series of peels for maximum results.

What About Home Care?

There are a few measures you can take to help your skin heal. Aerobic exercise or vigorous physical activity should be avoided for the first forty-eight hours. Avoid rubbing or scratching areas of the face that have been treated. Direct sunlight/indoor tanning is to be completely avoided following the treatment. Sunscreen with an SPF of at least fifteen should become a part of daily skin care regimen as your skin will become more sensitive to the sun as a result of the peel.

Finally, avoid applying moisturizers or other products that may contain harsh chemicals, dyes, or perfumes to your skin until it has completely healed. Your skin care professional will explain the home care regimen that is right for you and send you home with written instructions.
